

## **ABSTRACT**

A command line utility is described that overlays the management infrastructure of an enterprise to provide easier command options for administrators to effectively manage the enterprise. The primary intent of the  
5 command line utility is to facilitate management of the environment without requiring administrators to write scripts or navigate a vast schematized enterprise exposed through the management infrastructure. The command line utility provides command options through class aliases that enable the mapping of management queries and operations to a common term or friendly name that can  
10 be extended both in an alias file or at run time in the command line.
